Towards Efficient and Scalable RDMA Networking for Datacenters

Prof. Jin Wang

School of Computer Science and Engineering,
Hunan University of Science and Technology, Hunan, China

Abstract:

As datacenters continue to scale and evolve, the demand for high-performance, low-latency networking solutions has become increasingly critical. Remote Direct Memory Access (RDMA) technology has emerged as a key enabler for achieving these performance goals, offering direct memory access from the memory of one computer into that of another without involving either one's operating system. In this keynote, we will explore the latest advancements in RDMA networking, focusing on efficiency and scalability in large-scale datacenter deployments. We will discuss the fundamental principles of RDMA technology and its benefits over traditional networking approaches, including reduced latency, increased throughput, and lower CPU utilization. Key challenges in implementing RDMA at scale, such as congestion control, fault tolerance, and interoperability with existing network infrastructure, will be addressed. Attendees will gain insights into practical deployment considerations, real-world case studies, and performance benchmarking results that demonstrate the tangible benefits of RDMA in large-scale datacenter applications. By the end of this keynote, participants will have a comprehensive understanding of how to leverage RDMA technology to build efficient, scalable, and high-performance networking infrastructures capable of meeting the demands of next-generation datacenters.
